Raw data formats

Motivation for Receiver INdependent EXchange (RINEX) format

- All manufacturers have developed their own proprietary file formats for data storage specific to their receivers and processing software
  - Problems occur when processing data from another manufacturer's receiver
- RINEX developed by the Astronomical Institute of the University of Berne to allow easy and universal exchange of raw GPS data
  - Principal driver was the large European GPS campaign EUREF 89 - involved more than 60 GPS receivers of 4 different manufacturers.

RINEX formats

- RINEX 2
  - Short file names (explained in proceeding slides)
- RINEX 3
  - Long file names (explained in proceeding slides)
- GAMIT formerly worked with the RINEX 2 format and GPS observables only
- Support for RINEX 3 and GNSS (e.g. GLONASS) observables are now available from 10.61

RINEX (2) data format

- Includes text file formats for:
  - observation ("o")
  - navigation ("n") } most important for most users
  - meteorological ("m")
  - ionospheric data ("i")
- Latest definition at ftp://ftp.igs.org/pub/data/format/rinex211.txt
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
  - Contains header labels in columns 61-80 for each line contained in the header section
  - These labels are mandatory and must appear exactly as per format description
- RINEX 2 filename convention:
  - For site SSSS, on day-of-year DDD, session T and year YY:
    - SSSSDDDT.YYo (RINEX observation file ie the site's GPS data)
    - SSSSDDDT.YYn (RINEX navigation file ie the broadcast ephem)
  - E.g., hers1270.03o is observation data for Herstmonceux, day 127, session 0, year 2003.
- All the dates and times in GPST

An example of RINEX (2) observation data

```
         2                  OBSERVATION DATA                        RINEX VERSION / TYPE

RINEX (3) data format

- Must be able to accommodate increased number and complexity of observations from multi-GNSS observations (GPS, GLONASS, Galileo, etc.)
- Latest definition at ftp://ftp.igs.org/pub/data/format/rinex303.pdf
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
  - Contains header labels in columns 61-80 for each line contained in the header section
  - These labels are mandatory and must appear exactly as per format description
- RINEX 3 filename convention is longer and more complicated than for RINEX 2, e.g.
  TG0100USA_R_20150010000_01D_30S_GO.crx.gz

Monument and receiver indices

Data source (R = receiver)

Observation interval and type

4-character site ID (same as RINEX 2)

ISO country code

First epoch (YYYYDDDhhmm)

File length (01D = 1 day)

Compressing/Uncompressing RINEX

- File compression
  - "*.zip" files
    - Uncompress using "unzip", "pkzip" or "WinZip"
    - See http://www.pkware.com/ or http://www.winzip.com/ , or http://www.7-zip.org/
  - "*.??o.Z" (RINEX 2) and "*.rnx.gz" (RINEX 3) files (UNIX `compress` or `gzip`)
    - e.g., hers0010.02o.Z, TG0100USA_R_20150010000_01D_30S_GO.rnx.gz
    - Uncompress using "`uncompress`", "`gunzip`", "7zip", "WinZip" or similar
  - "*.??d.Z" (RINEX 2) and "*.crx.gz" (RINEX 3) files (Hatanaka compression)
    - e.g., hers0010.02d.Z, TG0100USA_R_20150010000_01D_30S_GO.crx.gz
    - Need to uncompress as above to get *.??d and *.crx files
    - Then need to 'unHatanaka' using `CRX2RNX` from http://sopac.ucsd.edu/dataArchive/hatanaka.html
  - Leica Geo Office uncompresses files automatically when using "Internet Download" tool. For manual import you need to uncompress the files manually

runpkr00 (Trimble raw to dat)

- Proprietary software from Trimble
- Maintained by UNAVCO nowadays
  - http://facility.unavco.org/kb/questions/744/
- `runpkr00 -g -adeimv <raw file> [dat-file root]`
- Converts raw data from Trimble receiver to teqc-compatible input "dat"-file
- Always use "-g" option separately from other options

Pre-processing data

- Some level of data quality control may be performed prior to any data processing

- Utilities are available to perform simple but valuable tests
  - The most common example is TEQC (pronounced "tek")
    - **T**ranslate, **E**dit, **Q**uality **C**heck
    - Translates common binary formats to RINEX format
    - Header editing, windowing, splicing of RINEX data
    - Quality check in 'lite' mode (no navigation file) or 'full' mode (navigation file available)
    - Download for *free* from

  http://www.unavco.org/facility/software/teqc/teqc.html#executables

Using teqc

- Be sure to use correct raw format
  - `teqc -tr d <Trimble .dat file>`
  - `teqc -ash d <Ashtech B-file, etc.>`
- Ability to control observations using "-O.obs"
  - `teqc -O.obs L1L2C1P2 -tr d <Trimble .dat file>`
- Ability to control header information with other "-O.xxx" options
  - `teqc -O.o "M. Floyd" -O.obs L1L2C1P2 -tr d <Trimble .dat file>`
- May create and use a teqc configuration file for consistent information
  - `teqc -config teqc.cfg -tr d <Trimble .dat file>`
- Use a script or command line loop to create RINEX files in batch

TEQC

- ## Quality Control (QC)
  - In 'lite' mode, teqc doesn't know anything about the satellite positions
    - `teqc +qc site1891.02o > teqc.out`
    - 7 files generated; use the -plots switch to prevent all but the summary ('S') file being generated
  - In 'full' mode, additional information is available based on the satellite positions
    - `teqc +qc –nav site1891.02n site1891.02o > teqc.out`
    - 9 files generated (elevation and azimuth of satellites)
  - Full solution if navigation file matches observation file, e.g. site1891.02o and site1891.02n,
    - `teqc +qc site1891.02o > teqc.out`

Approximate position

Accurate a priori coordinates necessary for good GPS processing

1. Run teqc to create RINEX observation and (broadcast) navigation files, e.g.

```
teqc +nav abcd3650.14n +obs abcd3650.14o –tr d 12343650.dat
```

2. Run teqc in qc-mode on observation file with navigation file to get pseudorange-derived estimate of approximate coordinate, e.g.

```
teqc +qc –nav abcd3650.14n abcd3650.14o
```

May also be done using GG's `sh_rx2apr`
