

GNSS data from receiver to processing input

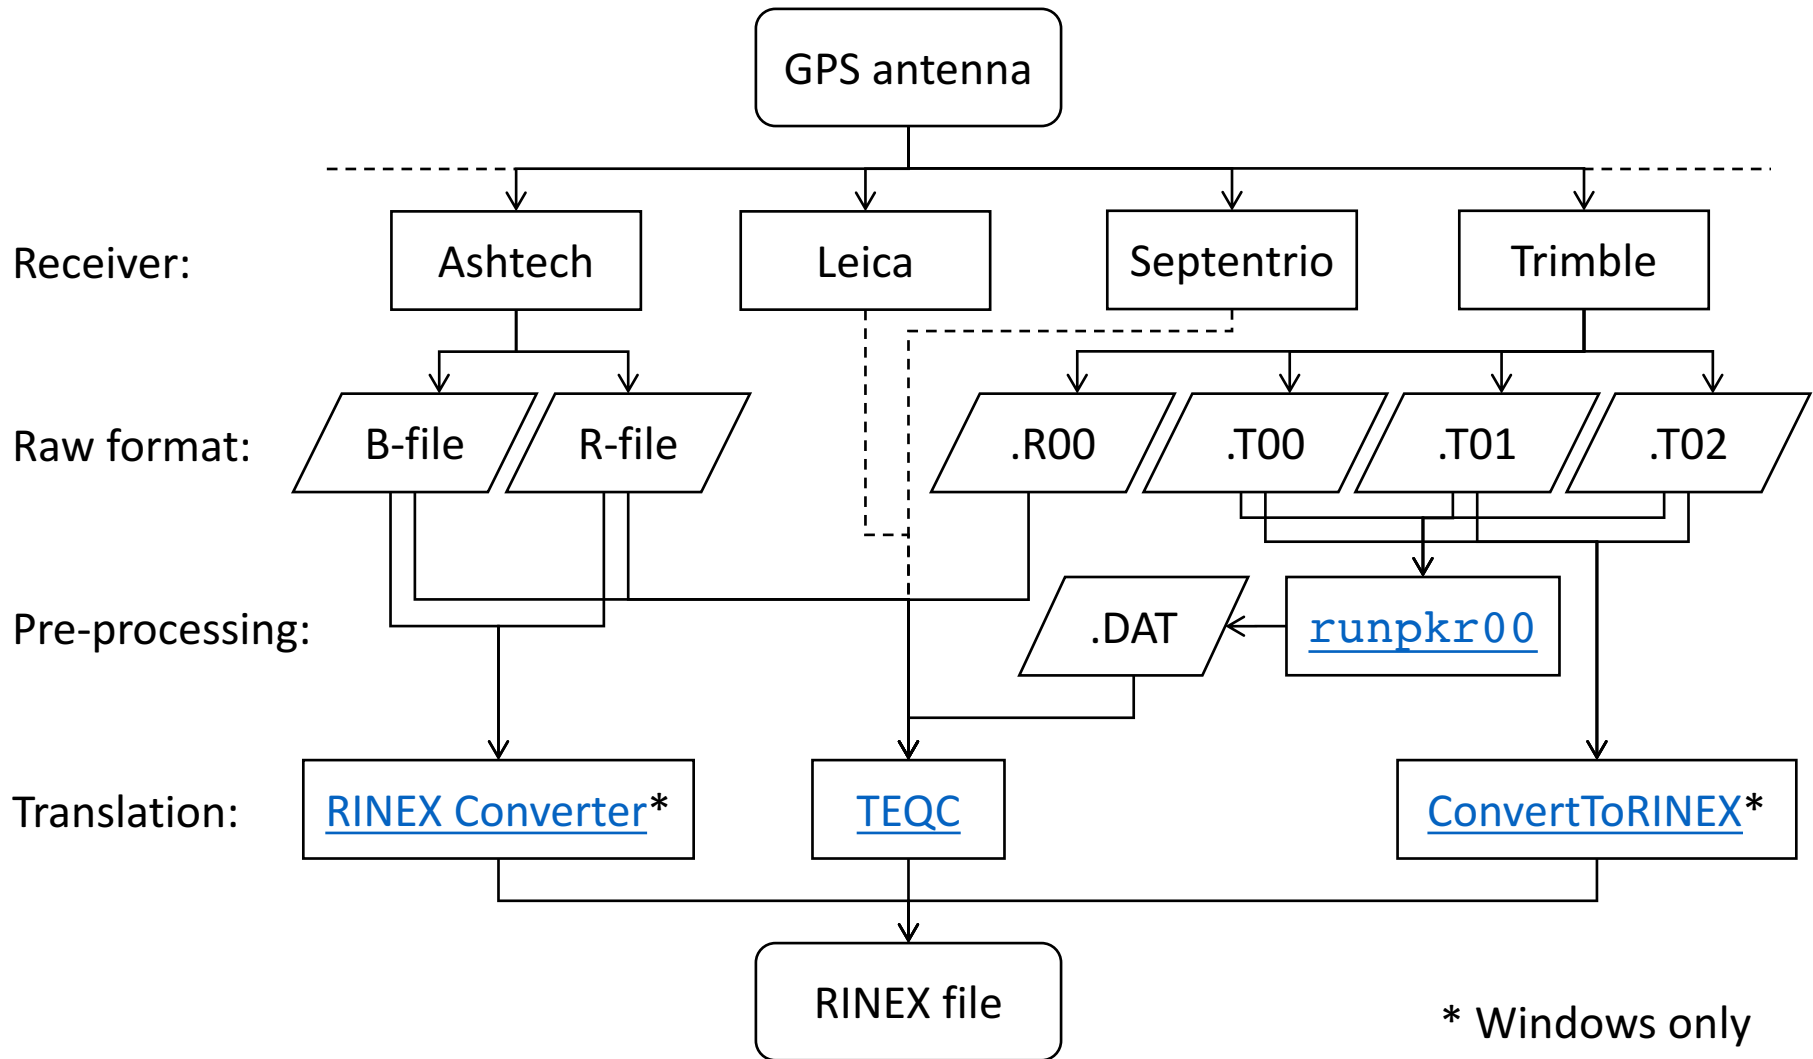

T. A. Herring M. A. Floyd R. W. King
Massachusetts Institute of Technology, Cambridge, MA, USA

GPS Data Processing and Analysis with GAMIT/GLOBK/TRACK
UNAVCO Headquarters, Boulder, Colorado, USA
19–23 June 2017

http://web.mit.edu/mfloyd/www/courses/gg/201706_UNAVCO/

Material from R. W. King, T. A. Herring, M. A. Floyd (MIT) and S. C. McClusky (now at ANU)

Raw data formats

Motivation for Receiver INdependent EXchange (RINEX) format

- All manufacturers have developed their own proprietary file formats for data storage specific to their receivers and processing software
 - Problems occur when processing data from another manufacturer's receiver
- RINEX developed by the Astronomical Institute of the University of Berne to allow easy and universal exchange of raw GPS data
 - Principal driver was the large European GPS campaign EUREF 89 - involved more than 60 GPS receivers of 4 different manufacturers.

RINEX formats

- RINEX 2
 - Short file names (explained in following slides)
- RINEX 3
 - Long file names (explained in following slides)
- GAMIT formerly worked with the RINEX 2 format and GPS observations only
- Support for RINEX 3 and GNSS (e.g. Galileo, BeiDou, etc.) observations are now available as of GAMIT/GLOBK 10.61
 - But RINEX 3 files need to be renamed, copied or linked with a RINEX 2 file name convention to be used (e.g. `sh_rename_rinex3`)

RINEX 2 data format

- Includes text file formats for:
 - observation (“o”)
 - navigation (“n”) } most important for most users
 - meteorological (“m”)
 - ionospheric data (“i”)
- Latest definition at <ftp://igs.org/pub/data/format/rinex211.txt>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
 - Contains header labels in columns 61–80 for each line contained in the header section
 - These labels are mandatory and must appear exactly as per format description
- RINEX 2 filename convention:
 - For site “ssss”, on ordinal date (day-of-year) “ddd”, session “t” and year “yy”:
 - ssssdddt.yyo (RINEX observation file, i.e. the site’s phase and code records)
 - ssssdddt.yyn (RINEX navigation file, i.e. the broadcast ephemeris)
 - e.g., hers1270.03o is observation data for Herstmonceux, day 127, session 0, year 2003
- All dates and times in GPST

An example of RINEX 2 observation data

```

RINEX 3 data format

- Must be able to accommodate increased number and complexity of observations from multi-GNSS observations (GPS, GLONASS, Galileo, BeiDou, etc.)
- Latest definition at <ftp://igs.org/pub/data/format/rinex303.pdf>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
 - Contains header labels in columns 61–80 for each line contained in the header section
 - These labels are mandatory and must appear exactly as per format description
- RINEX 3 filename convention is longer and more complicated than for RINEX 2, e.g.

An example of RINEX 3 observation data

```

Annotations in the image include:

- Red circles around observation codes: C1C, C2W, C2X, C5X, L1C, L2W, L2X.
- Red labels "L2" and "L2C" above the L2W and L2X codes.
- Red arrows pointing from the circled codes to their respective values in the data lines.
- A blue box around the header line "SYS / # / OBS TYPES" with a blue arrow pointing to the "System now listed along with observation types" text.
- A blue box around the "G01" code in the data line.

System now listed along with observation types

Observation codes more complicated than RINEX 2 (see Tables 4–10 of current RINEX 3(.03) document)

Compressing/Uncompressing RINEX

- File compression
 - “*.zip” files
 - Unzip using “unzip”, “pkzip” or “WinZip”
 - See <http://www.pkware.com/> or <http://www.winzip.com/>, or <http://www.7-zip.org/>
 - “*.??o.Z” (RINEX 2) and “*.rnx.gz” (RINEX 3) files (UNIX compress or gzip)
 - e.g., hers1270.03o.Z, TG0100USA_R_20153650000_01D_30S_GO.rnx.gz
 - Uncompress using “uncompress”, “gunzip”, “7zip”, “WinZip” or similar
 - “*.??d.Z” (RINEX 2) and “*.crx.gz” (RINEX 3) files (Hatanaka compression)
 - e.g., hers1270.03d.Z, TG0100USA_R_20153650000_01D_30S_GO.crx.gz
 - Need to uncompress as above to get *.??d and *.crx files
 - Then need to “unHatanaka” using CRX2RNX from <http://terras.gsi.go.jp/ja/crx2rnex.html>
 - Leica Geo Office uncompresses files automatically when using “Internet Download” tool
 - For manual import you need to uncompress the files manually

runpkr00 (Trimble raw to dat)

- Proprietary software from Trimble
- Maintained by UNAVCO nowadays
 - <http://facility.unavco.org/kb/questions/744/>
- Converts raw data from Trimble receiver to teqc-compatible input “dat”-file, e.g.

```
runpkr00 -g -adeimv <raw file> [dat-file root]
```
- Always use “-g” option and separately from other options

Pre-processing data

- Some level of data quality control may be performed prior to any data processing
- Utilities are available to perform simple but valuable tests
 - The most common example is TEQC (pronounced “tek”)
 - **T**ranslate, **E**dit, **Q**uality **C**heck
 - Translates common binary formats to RINEX format
 - Header editing, windowing, splicing of RINEX data
 - Quality check in “lite” mode (no navigation file) or “full” mode (navigation file available)
 - Download for free from
<http://www.unavco.org/facility/software/teqc/teqc.html#executables>

Using teqc

- Be sure to use correct raw format

```
teqc -tr d <Trimble .dat file>  
teqc -ash d <Ashtech B-file, etc.>
```

- Ability to control observations using “-O.obs” option

```
teqc -O.obs L1L2C1P2 -tr d <Trimble .dat file>
```

- Ability to control header information with other “-O.xxx” options

```
teqc -O.o "M. Floyd" -O.obs L1L2C1P2 -tr d <Trimble .dat file>
```

- May create and use a teqc configuration file for consistent information

```
teqc -config teqc.cfg -tr d <Trimble .dat file>
```

- Use a script or command line loop to create RINEX files in batch

Using teqc

- Quality Control (QC)

- In “lite” mode, teqc doesn’t know anything about the satellite positions

```
teqc +qc site1891.02o > teqc.log
```

- 7 files generated; use the `-plots` option to prevent all but the summary (‘S’) file being generated

- In “full” mode, additional information is available based on the satellite positions

```
teqc +qc -nav site1891.02n site1891.02o > teqc.log
```

- 9 files generated (elevation and azimuth of satellites)

- Full solution if navigation file matches observation file, e.g. site1891.02o and site1891.02n

```
teqc +qc site1891.02o > teqc.log
```

Approximate position

Accurate a priori coordinates necessary for good GNSS processing

1. Run `teqc` to create RINEX observation and (broadcast) navigation files, e.g.

```
teqc +nav abcd3650.14n +obs abcd3650.14o -tr d 12343650.dat
```

2. Run `teqc` in `qc`-mode on observation file with navigation file to get pseudorange-derived estimate of approximate coordinate, e.g.

```
teqc +qc -nav abcd3650.14n abcd3650.14o
```

May also be done using GAMIT/GLOBK's `sh_rx2apr`
