

GNSS data from receiver to processing input

M. A. Floyd T. A. Herring

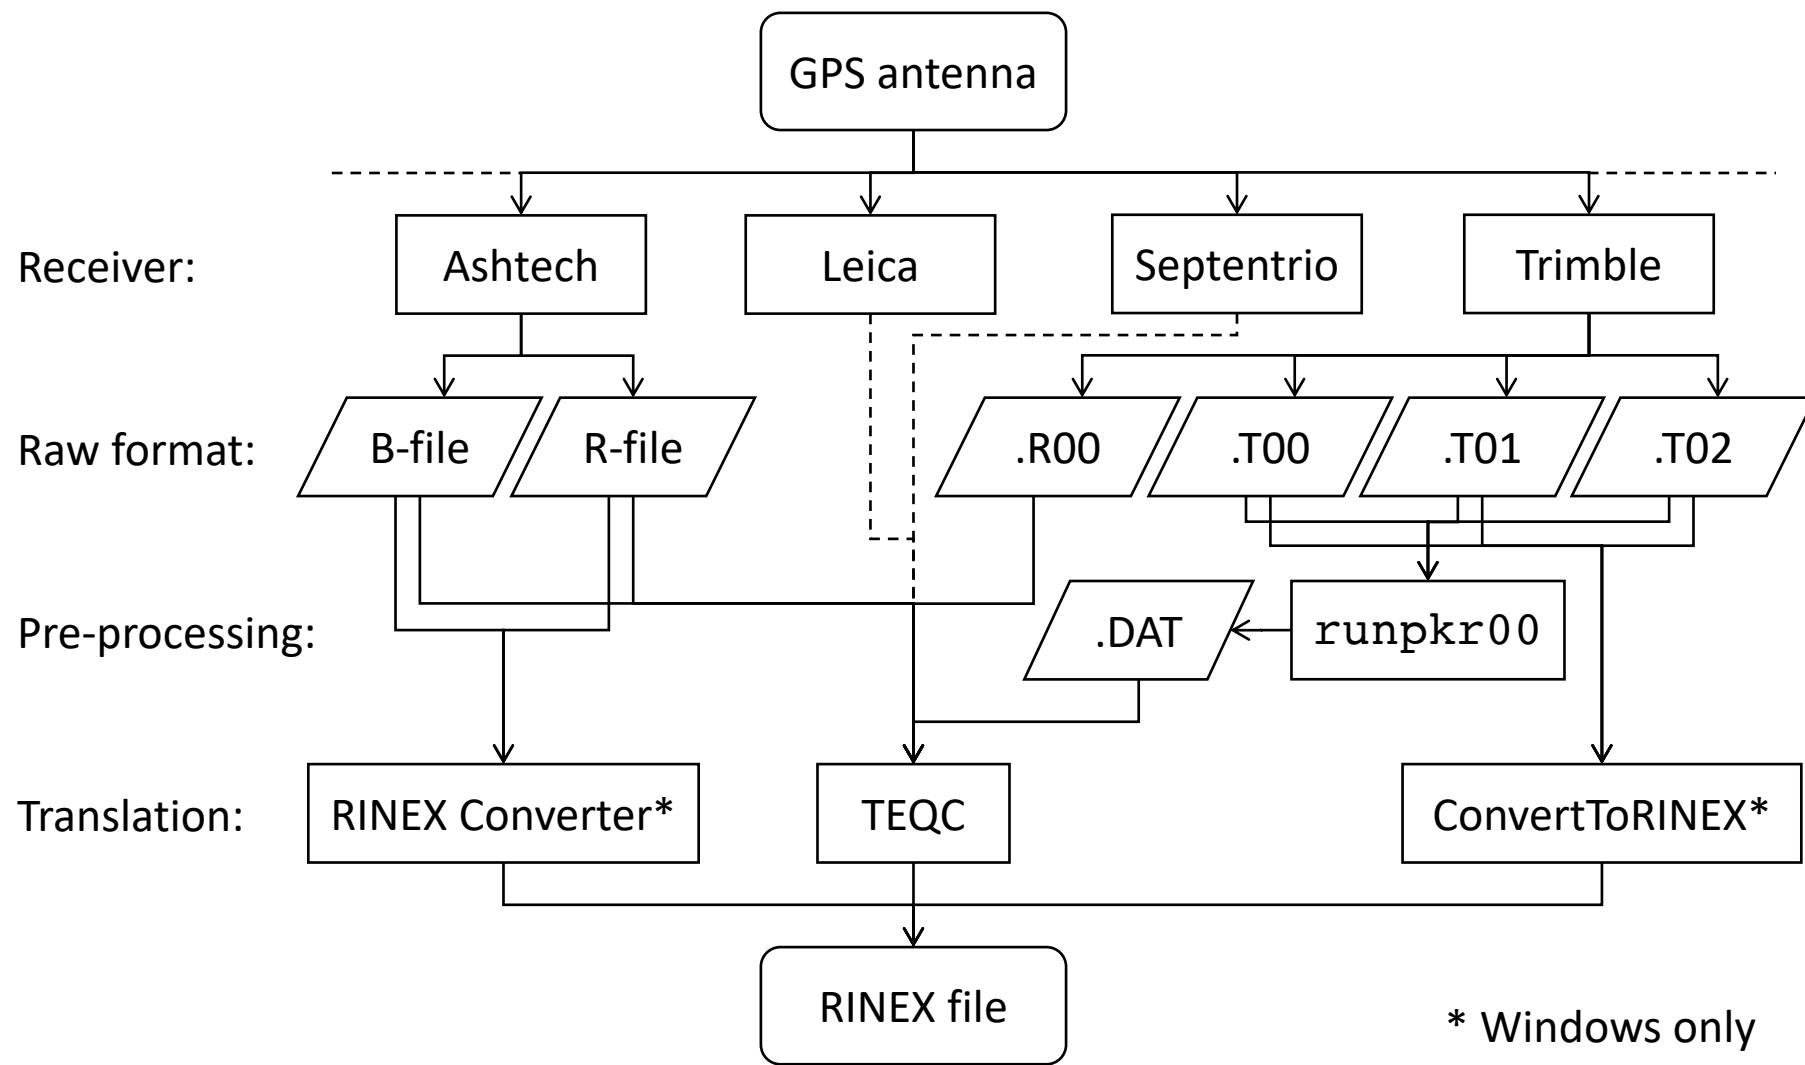

Massachusetts Institute of Technology, Cambridge, MA, USA

GNSS Data Processing and Analysis with GAMIT/GLOBK and track
UNAVCO Headquarters, Boulder, Colorado, USA
24–28 August 2020

http://geoweb.mit.edu/~floyd/courses/gg/202008_UNAVCO/

Material from R. W. King, T. A. Herring, M. A. Floyd (MIT) and S. C. McClusky (now at ANU)

Raw data formats

Motivation for Receiver INdependent EXchange (RINEX) format

- All manufacturers have developed their own proprietary file formats for data storage specific to their receivers and processing software
 - Problems occur when processing data from another manufacturer's receiver
- RINEX developed by the Astronomical Institute of the University of Berne to allow easy and universal exchange of raw GPS data
 - Principal driver was the large European GPS campaign EUREF 89 - involved more than 60 GPS receivers of 4 different manufacturers.

RINEX formats

- RINEX 2
 - Short file names (explained in following slides)
- RINEX 3
 - Long file names (explained in following slides)
- GAMIT formerly worked with the RINEX 2 format and GPS observations only
- Support for RINEX 3 and GNSS (e.g. Galileo, BeiDou, etc.) observations are now available with GAMIT/GLOBK 10.61 and later
 - But RINEX 3 files need to be renamed, copied or linked with a RINEX 2 file name convention to be used (e.g. sh_rename_rinex3)

RINEX 2 data format

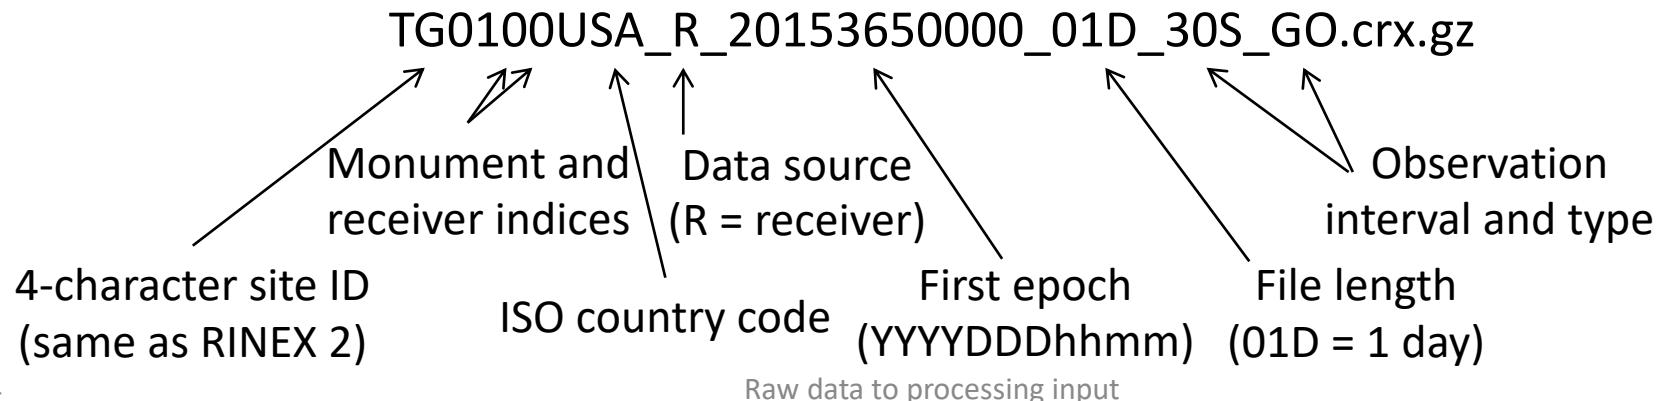

- Includes text file formats for:
 - observation (“o”)
 - navigation (“n”)
 - meteorological (“m”)
 - ionospheric data (“i”)
- Latest definition at <ftp://igs.org/pub/data/format/rinex211.txt>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
 - Contains header labels in columns 61–80 for each line contained in the header section
 - These labels are mandatory and must appear exactly as per format description
- RINEX 2 filename convention:
 - For site “ssss”, on ordinal date (day-of-year) “ddd”, session “t” and year “yy”:
 - sssssddt.yyo (RINEX observation file, i.e. the site’s phase and code records)
 - sssssddt yyn (RINEX navigation file, i.e. the broadcast ephemeris)
 - e.g., hers1270.03o is observation data for Herstmonceux, day 127, session 0, year 2003
- All dates and times in GPST, *not* UTC, by convention

An example of RINEX 2 observation data

PRN14
PRN05
PRN26
PRN07
PRN09

RINEX 3 data format

- Must be able to accommodate increased number and complexity of observations from multi-GNSS observations (GPS, GLONASS, Galileo, BeiDou, etc.)
- Latest definition at <ftp://ftp.igs.org/pub/data/format/rinex304.pdf>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
 - Contains header labels in columns 61–80 for each line contained in the header section
 - These labels are mandatory and must appear exactly as per format description
- RINEX 3 filename convention is longer and more complicated than for RINEX 2, e.g.

An example of RINEX 3 observation data

Observation codes more complicated than RINEX 2 (see Tables 4–10 of current RINEX 3(.04) document)

Compressing/Uncompressing RINEX

- File compression
 - “*.zip” files
 - Unzip using “unzip”, “pkzip” or “WinZip”
 - See <http://www.pkware.com/> or <http://www.winzip.com/>, or <http://www.7-zip.org/>
 - “*.**??o.Z**” (RINEX 2) and “*.**.rnx.gz**” (RINEX 3) files (UNIX compress or gzip)
 - e.g. hers1270.03o.Z, TG0100USA_R_20153650000_01D_30S_GO.rnx.gz
 - Uncompress using “uncompress”, “gunzip”, “7zip”, “WinZip” or similar
 - “*.**??d.Z**” (RINEX 2) and “*.**.crx.gz**” (RINEX 3) files (Hatanaka compression)
 - e.g. hers1270.03d.Z, TG0100USA_R_20153650000_01D_30S_GO.crx.gz
 - Need to uncompress as above to get *.**??.d** and *.**.crx** files
 - Then need to “unHatanaka” using CRX2RNX from <http://terras.gsi.go.jp/ja/crx2rnx.html>
 - Leica Geo Office uncompresses files automatically when using “Internet Download” tool
 - For manual import you need to uncompress the files manually

runpkr00 (Trimble raw to dat)

- Proprietary software from Trimble
- Maintained by UNAVCO nowadays
 - <https://kb.unavco.org/kb/article/trimble-runpkr00-latest-versions-744.html>
- Converts raw data from Trimble receiver to teqc-compatible input “dat”-file, e.g.
`runpkr00 -g -adeimv <raw file> [dat-file root]`
- Always use “-g” option and separately from other options

Pre-processing data

- Some level of data quality control may be performed prior to any data processing
- Utilities are available to perform simple but valuable tests
 - The most common example is TEQC (pronounced “tek”)
 - Translate, Edit, Quality Check
 - Translates common binary formats to RINEX format
 - Header editing, windowing, splicing of RINEX data
 - Quality check in “lite” mode (no navigation file) or “full” mode (navigation file available)
 - Download for free from
<https://www.unavco.org/software/data-processing/teqc/teqc.html#executables>

Using teqc

- Be sure to use correct raw format
`teqc -tr d <Trimble .dat file>`
`teqc -ash d <Ashtech B-file, etc.>`
- Ability to control observations using “-O.obs” option
`teqc -O.obs L1L2C1P2 -tr d <Trimble .dat file>`
- Ability to control header information with other “-O.xxx” options
`teqc -O.o “M. Floyd” -O.obs L1L2C1P2 -tr d`
`<Trimble .dat file>`
- May create and use a teqc configuration file for consistent information
`teqc -config teqc.cfg -tr d <Trimble .dat file>`
- Use a script or command line loop to create RINEX files in batch

Using teqc

- Quality Control (QC)
 - In “lite” mode, teqc doesn’t know anything about the satellite positions
`teqc +qc site1891.02o > teqc.log`
 - 7 files generated; use the -plots option to prevent all but the summary ('S') file being generated
 - In “full” mode, additional information is available based on the satellite positions
`teqc +qc -nav site1891.02n site1891.02o > teqc.log`
 - 9 files generated (elevation and azimuth of satellites)
 - Full solution if navigation file matches observation file, e.g. site1891.02o and site1891.02n
`teqc +qc site1891.02o > teqc.log`

Approximate position

- Accurate a priori coordinates necessary for good GNSS processing
- Run teqc to create RINEX observation and (broadcast) navigation files, e.g.
`teqc +nav abcd3650.14n +obs abcd3650.14o -tr d
12343650.dat`
- Run teqc in qc-mode on observation file with navigation file to get pseudorange-derived estimate of approximate coordinate, e.g.
`teqc +qc -nav abcd3650.14n abcd3650.14o`
- May also be done using GAMIT/GLOBK's `sh_rx2apr`
